Consumer Test Marketing Sta-Puf Air Freshener
It's Automatic;
Here's an Undate Here's an Update

In Four Scents

OAK BROOK, Ill.—Attracted by the sweet smell of success in the \$60 million air freshener category, the Consumer Products Group is test marketing an automatic air freshener for inhome use.

home use.

Called "Sta-Puf Automatic
Air Freshener", the new product
has the potential of becoming
one of the Group's foremost brands, according to product manager Rod Tinkler. Initial consumer accept-

ance of the product, which was introduced in December is "very favorable" Tinkler said.

Designed to be attached easily and quickly to most doors, the freshener's spray is actuated automatically by the closing of the door.

Under normal usage, the Staley product-being test priced at 98¢-lasts approximately one month.

Available in four scentscitrus, floral, fresh and pine-the product's primary advantage over conventional hand-held aerosol air fresheners is the automatic dispersal, Tinkler said.

Sta-Puf Air Freshener Attaches to the Back of a Door Inset Gives You a "Consumer's Eye" View of the New Product

matic dispersal, Tinkler said.

Supported by television advertising, newspaper coupon
Company an "exciting opportualmost \$60 million this year," ing and advertising, and point-of- nity in a growth market-one Tinkler stated

On SSR, Soft Plus

OAK BROOK, Ill.—Here's an update on the status of two additional Staley consumer items—Sta-Flo SSR (Soil/Stain Remover) and Soft Plus fabric conditioner—which have been in

test market just over a year.
For SSR, short-term plans are to expand the sale of the product into new markets, while product into new markets, while Soft Plus has been "marginally successful" with expansion plans awaiting further test market results, according to the two product managers.

SSR's performance has been affected somewhat by the adoption of local anti-phosphate

adoption of local anti-phosphate regulations, even though the Staley product contains less than 5% phosphate. As a result, product manager Jim Titus said, SSR has been reformulated and performs "as well as or better" than the original formula.

Thus, longer-range plans SSR include expansion of the non-phosphate formula into additional markets when new packaging is available.

Soft Plus, on the other hand, has been affected by the

Staley Research Develops New Starch And Analytical Capability for Paper

Through investigative ingenuity, Staley research has developed a new starch and an analytical capability that result in more efficient paper manufac-

turing.

While developing the new corn starch—Sta-Lok A-200—the research team gained a deeper understanding of the paper manufacturers' wet end system, resulting in a systematic analysis of the system and determination of the Staley starch the custo-mer needs for efficient paper

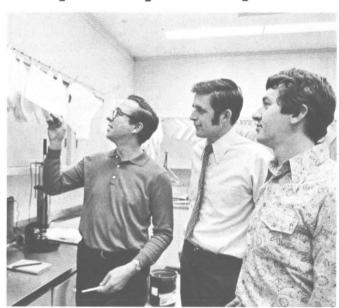

Key to the analysis, Don Johnson, paper and paper converting group leader, said, is Staley's ability to determine the characteristics of the basic slurry of paper pulp and additives the customer uses at the wet end. Once this determination is made, Johnson added, Staley can pro-vide the customer with the new Sta-Lok A-200 (negatively charged) or any one of a family of cationic (positively charged)

These products-along with analytical capability-put Staley in an advantageous competitive position, according to paper sales manager Bill White. "With this capability,"

te said we can most customers with a product that will perform well in the wide range of wet end systems.'

Describing the product as 'in the evaluation period', White said mill trials are presently being conducted by two of the nation's larger papermakers.

Initial development of Sta-Lok A-200 and analyses of wet end systems took place under the direction of Leonard Vander Burgh, senior scientist, industrial products R&D. Further results were achieved by Ken Moser's starch development lab. Applications research and field testing are being conducted by chemist

A Primary Application of Sta-Lok A-200 Is for Writing Papers (L-R) Len Vander Burgh, Ken Moser, and Larry Avery Check a Sample

from Bill Turner's paper technical services team as well as paper

Manufactured in Decatur, tions in wet end systems are to provide more efficient filler retention (90% efficiency vs. 70-80% by other starches) and to increase the paper's strength

According to Vander Burgh, Sta-Lok A-200 is most effective for producing paper

with good moisture resistance.
"Writing papers and stationary are examples," he said, "since they must resist moisture from the writer's hand or from water-based ink."

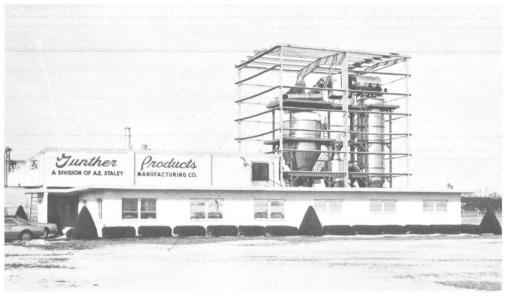

Commenting on the new Staley capability, Johnson said education is one of the major challenges.

"This is a unique solution," he said. "One with which our research and sales personnel must be thoroughly knowledgeable before we can fully educate ustomers

Directors Declare Usual Dividend On Staley Stock

On February 8, directors declared a regular quarterly dividend of 35 cents per common share, payable March 7 to shareholders of record February

The usual dividend of 94 cents per share was declared on the Company's \$3.75 preference stock. It is payable March 20 to shareholders of record March 6.

A Major Portion of the Capacity-Doubling Construction at Gunther Products Is this New Spray Dryer

Gunther Expansion Graphic Evidence The Emphasis Is on Specialty Products

of the Gunther Products manufacturing facility here is graphic evidence of Staley's emphasis on sophisticated specialty food ingredients.

When completed, the expansion will enable the Gunther operations to double its produc-tion of soy-derived whipping agents and proteins, which are used in a variety of candy and baking applications.

baking applications.

Against the backdrop of the expanded production capability and the emphasis on specialty items, specialty products manager N.R. Lockmiller forecasts "expanded sales for the Capatheau its the Light and the sales of the Capatheau its the Light and the sales of the Capatheau its the Light and the sales of the Capatheau its the Light and the sales of the Capatheau its the Light and the sales of the Capatheau its the sales of Gunther items in the United States and in foreign markets."

For Gunther Products, the expansion is a major milestone in the firm's 23-years of

operation.
"It's by far the largest undertaking since we started in 1949," manager Ken Gunther said. "At \$500,000, this project represents a larger dollar expenditure than the original cost of the plant."

The major unit in the ex-

pansion is a spray dryer designed specifically for the Gunther application. According to project engineer Harold Graves and process engineer Bill Weaver, the dryer incorporates the following features

+An environmental emiscontrol system rated at 99%-plus efficiency

+All stainless steel construction

"clean-in-place" system that allows the dryer to be

The Unit at the Left Is the Stainless-Steel Spray Dryer Units in Center and on Right Are for Emission Control Purposes

sanitized automatically +An "absolute" intake air that screens out even microscopic-sized particles

+Clean-burning natural gas Additional e ngineering support for the expansion was provided by Bill Armentrout and Harold March, field engineers; Rich Mosier, process engineer; Richard Barnett, structural engineer; and Roger Johns, drafts- entries.

Record-Setting Dextrose Plant Employees and Wives Take a Tour

In recognition for recordbreaking production during January, approximately 70 dextrose plant employees and their wives were treated to a "special day" by the Company on February 13.

The treat started with a guided tour, conducted by In-dustrial Products staff employees, of the administration building, continued with a guided tour by syrup refinery/ dextrose personnel of the dextrose plant, and concluded with a dinner at a local restaurant.

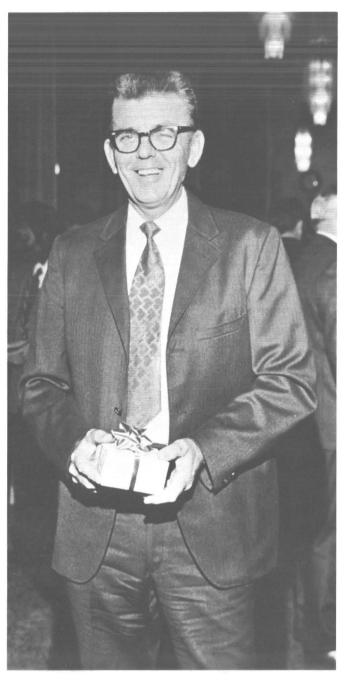

Records set by the employees include: record monthly output, record daily production rate, record high output/input yield, record low in process losses, and zero losses due to mechanical failure.

For most of the wives, it was the first time they had seen plant in either the dextrose operation or the administration building since its renovation last year. Judging from their comments, they enjoyed both.

Guest speaker for the evening was the Reverend Charles H. Willey, former pastor of the First Christian Church, Moline, and presently engaged full-time in speaking and civic affairs

affairs.

The evening's toastmaster was Thomas C. Garren, manager, technical services, Industrial Products.

Coordination of the banquet and pre-banquet arrange-ments was handled by a com-mittee headed by Harold Smith and Kathleen Poe.

Don't Tie Industry's Hands in Environmental Red Tape'

"Red tape and paperwork are so much a part of proposed new Illinois environmental regulations that they threaten to severely hamper industry's clean air efforts as well as create a bureaucratic cost burden on the taxpayer."

This is the initial overview of Dr. William P.

This is the initial overview of Dr. William P. Hagenbach, our director of environmental sciences and engineering, after six weeks of intensive exposure to this complex and critical subject.

According to Hagenbach, the proposed air quality regulations, drafted by the Illinois Environmental Protection Agency (EPA) in an attempt to satisfy the federal "Clean Air Act", require industry to maintain and submit a myriad of unnecessity. try to maintain and submit a myriad of unnecessary information.

"Unfortunately," Hagenbach said, "this unnecessary red tape and paperwork increase administrative efforts and hamper industry's pursuit of environmental solutions.

Results: Increased Expenses and State Bureaucracy

"The net result will be drastic increases in industry's environmental-related administrative expenses and the creation of an administrative

bureaucracy in Springfield.
"Drastic increases in these administrative expenses for Illinois industry could weaken the competitive position of Staley and other Illinois firms who compete with industries in states not requiring such extensive administrative efforts."

The major portion of the red tape, according to Hagenbach, is created by several subsections dealing with environmental control equipment and programs-the filing of requests for construction and operating permits; the submission of detailed plans for compliance programs and project com-pletion schedules; the installation and monitoring of test equipment; and the filing of numerous

Call for Construction and Operating Permits

Under the proposed regulations, Staley and other Illinois firms would be required to apply for construction permits for all new emission sources or pollution control equipment as well as for emission-increasing modifications to existing

This construction permit application must include: the nature of the emission source or control equipment, including the expected life; information on the process, including quantities and types of raw materials; sources, types and quantities of air contaminants; equipment specifications, including drawings, plans and specifica-tions; the location of the emission source or control equipment; description of composite picture of other emission sources; and essentially any other data the EPA may require.

Upon receiving a construction permit and

before operating the equipment, a firm is required to apply for an operating permit. The information required under this permit is similar to that for a construction permit. Valid for a maximum of five years or until there is any change in emission regulations, all applications for operating permits must then be refiled.

In addition, industry may also be required to install monitoring devices on each emission source and record and report the results. This requirement alone, Hagenbach stated, would necessitate an industrial staff of full-time laboratory and recording personnel to gather, record, audit and file the information.

Staley Could Conceivably File 200,000 Pages

In compiling an estimate on the extent of the paperwork required under these regulations, the Company's engineering and legal staffs con-servatively estimated that to satisfy the "operating permit" subsection alone, Staley might conceivably be required to file as many as 200,000 pages of documents. This, Hagenbach pointed out, is in addition to the several hundred pages of documents the Company has already filed with the EPA in obtaining construction and operating

permits.
"Those documents already filed should be

sufficient," Hagenbach said.

"However, by considering that Staley alone might have to file 200,000 pages just to technically satisfy one subsection, the taxpayer gains a clear perspective of the tremendous administrative burden and costs which can result from these proposed regulations.

Dr. Hagenbach Proposes Alternatives

Instead of the EPA's red tape-cluttered regulations, Hagenbach proposed the following alternatives.

"The EPA should work toward setting emission standards and regulations requiring a minimum of paperwork and reporting.

"Permit applications should be simplified. "Construction and operating permits should

be combined.

'Essentially," Hagenbach said, "the EPA should function the same as any other enforcement agency and keep its eye on the target of clean ambient air. It should enforce the important regulations and not require industry to prove it is adhering to a maze of miscellaneous details.

"The EPA's proposed regulations are analogous to a city police department that requires citizens to report and certify, on a routine basis, that they haven't broken any laws.'

'Unfortunately, the unnecessary red tape and paperwork increase administrative efforts and hamper industry's pursuit of environmental

"We must not lose sight of our goal, namely

"Whatever deters us from this goal must be eliminated."

Meet the Professionals--The Environmental Staff That Keeps Staley out Front in the Industry

Here's an overview of the Company's present environmental quality staff as well as a synopsis of the functions these employees perform.

At Decatur, there are 21 scientists, engineers and technicians engaged in full-time pursuit of the Company's environmental goals. In addition, there are several other key employees on the operating level whose responsibilities include adminis-

tering effective pollution control.
Dr. William P. Hagenbach, 12year employee with a Ph.D. degree in chemical engineering, is director of environmental sciences and engineering. Reporting to Roger Mauterer, director of engineering, Hagenbach is responsible for all aspects of pollution control technology at the Company's 11 U.S. plants as well as for liaison with the various environmental

Reporting to Hagenbach are three environmental engineers—Bob Popma (liquid and solid wastes), Bob Nisbet (air and noise), and Dan Taylor (sanitation, occupational health and

In research, chemical engineers Charles Schollmeier and Dale Maley, under the direction of pilot plant and process development head Roger Leiser, are working on developing new technology for specific air and water quality control applications.

And, in corn milling and chemicals, loss control engineer Craig Larson's full-time responsibility is implementing controls and procedures for preventing sewer and air losses by various operating units.

Here's Part of Staley's Professional Environmental Control Team (L-R) Bob Nisbet, Dan Taylor, Bob Popma with Dr. Hagenbach

At the control lab and at the Company's waste treatment facility there are 14 employees engaged in full-time environmental activities. Primary responsibilities of those at the control lab are to take samples at various monitoring points, analyze the samples and report the results. Employees at the waste treatment facility are responsible for operating the plant 24 hours a day.

In addition, particularly since last fall, the Company's legal staff has been involved in assisting Staley spokesmen in various environmental proceedings in Illinois and nine other states in which Staley has manufacturing facilities. During this period, corporate legal counsel Ray Stanhope and assistant Jay Holmes figure they have devoted 25 percent of their time to these efforts.

If the state's air quality implementation plan is approved by the federal government, most of the paperwork requirements are scheduled to go into effect later this year. In the meantime, Staley has been joined by a host of other manufacturers including the state's major oil and utility firms, as well as the Illinois Manufacturers Association, in objecting to the unnecessary red tape

In summary, Hagenbach said the proposed Illinois regulations contain more unnecessary red tape than any of the ten states in which Staley has manufacturing facilities and which also have proposed implementation plans in response to the federal "Clean Air Act."

"In Illinois, we must not lose sight of our goal, namely clean air and water. To meet this goal regulations must be adopted under which industry can achieve the desired results in the most effi-

cient, cost-effective manner.
"Whatever deters us from this goal must be

vice president and account supervisor, and previous to that held management positions in sales and advertising with National Tea for four years and with The Kroger Company for four years.

On the Brooks-Nagle announcement, Wagner said, "We are indeed fortunate to have a man of Bill Brooks' broad experience and demonstrated effectiveness to build upon the excellent foundation in terms of marketing organization and upgraded techniques which Dick Nagle has engineered so successfully over three very difficult transitional years in our Consumer Products Group."

In his new assignment, Nagle will be located in Atlanta, Georgia, his former home of

several years.

For the past year, Stehr had been general manager of the Group's citrus operations in Florida. A 15-year Staley employee, he previously served for one year as assistant treasurer on

the corporate financial staff, and for seven years in various grain and refined oil management positions in the former soybean division.

Tinkler joined the Consumer Products Group in July, 1970 as product manager with most recent responsibility for Sta-Flo ironing aids as well as Sta-Puf Automatic Air Freshener, recently introduced into test markets. Previously, Tinkler had been brand manager at Quaker Oats for one year and with R.T. French for eight years.

Cost-Saving Program at Decatur Closes out 1971 on a High Note

With a record number of awardees receiving Staley common stock for a record number of cost-saving ideas, the TEAM program at Decatur closed out 1971 on a high note.

On hand to congratulate the TEAM's and pass out awards at the annual banquet, February 9, at the Decatur Club were group vice presidents Nat Kessler and Tom Fischer along with profit center representatives Bob Schwandt, Tom Garren, and Dave Hopkins.

TEAM-of-the-year award went to syrup/dextrose TEAM 8 (Hal March, John Rasche, Waymond Ledbetter, Vern Parks, Bill Paslay, Jack England, George Spates, and Ron Wells). Winner in this category is based on cost-reduction dollar totals, number of ideas, selection as TEAM of the month, and awards received in special categories.

received in special categories.

The Thinker trophy, presented to the group with the most completed ideas per member, went in a dead heat to corn milling TEAM 32 (Floyd Lenover, Bob Swift, Vern Will, Jess Jolly, Roger Swift, Bill Brumaster, Bill Lindsten, Charlie O'Dell, Gary Saathoff, and Russ Wilber) and TEAM 8.

The Comeback Award, presented to the section with the greatest increase in cost reduction over the previous year, was given to corn milling, with section head Tom Wheatley accepting.

In addition, awards were presented in four special categories—environmental control,

quality, sanitation, and safety. Winning TEAM's and ideas were:

Environmental control-Dry starch TEAM 18 (Harry Atkins, Bob Etherton, Jerry Reece, Bob Siweck, Ed Schwalbe, Bill Huebner, Jim Wilson, Bud Luster, Bob Schnell, and Wayne Grotjan) for suggesting that disposal of waste paper and wood be handled by a vendor, avoiding incineration by Staley.

Quality—Dry starch TEAM 20 (Art Peterson, Charles Lake, Dick Vail, Merle Simmons, Jack Tuschhoff, Henry Burge, Everett Tetley, Art Thompson, Larry McLaughlin) for suggesting that air be used to clean out starch distribution lines, reducing starch deposits.

Sanitation—AgriProducts TEAM 11 (Carl Simroth, Charles Frey, George Russell, Paul Stroyeck, Rich Mosier, Bryan Bomball, Bill Evans, Don McKinney, and John Neuber) for the installation of a dust collection system at the east end of the grain conveyor.

Safety—Dry starch TEAM

Safety—Dry starch TEAM 20 for the installation of rupture discs for chemical hoses in 16 bldg., reducing danger of hoses rupturing and spraying chemical on the operator.

In many of the categories

In many of the categories the competition was extremely close with only scant points separating first and second place. Commenting on this, TEAM administrator Dennis Stevenson congratulated all groups for the spirited competition and a job well done.

1,000 Guests Attend Open House at Staley Morrisville
